

PcVue Announces Intelligent Measurement for US Oil & Gas Market

Automated Verification is Breakthrough for Production Accounting and Operations.

July 22, 2014

PcVue announces it entered a partnership with TinBox Energy Software to market its innovative IM-SCADA™ Software in the US. The solution enables Exploration and Production companies to meet regulatory requirements, reduce liability, and streamline gas production.

SCADA benefits to production operations are well established. The PcVue IM-SCADA™ solution consolidates real-time measurement, laboratory gas composition and calibration history from flow computers and electronic flow measurement devices for a true “intelligent measurement” solution. Deployed as either a complete SCADA system, or a component of existing systems, this produces clean, valid and auditable production reports via a desktop application or mobile devices.

Securing and validating audit trails at the source is a cornerstone of Sarbanes/Oxley and other regulatory compliance. Validated and auditable data for production accountants enables accurate calculation or re-calculation of volumes and quality of gas or liquids within minutes.

IM-SCADA™ enables field operations to manage balances and nominations. The system also enables field allocation of sales volumes, whether by energy or volume.

“Elimination of losses from production accounting and improving production operations has a rapid ROI.” said Frank Tarbox, TinBox Energy President. “The protection against lawsuits and government actions due to inaccurate production reporting are important in the US as well as Canada.”

“We are extremely pleased to offer IM-SCADA™,” said Edward Nugent, Business Development Director for PcVue. “We’ve seen the value to Canadian E&P’s and are excited to bring it to the US oil & gas market.”

About TinBox Energy, Inc.

TinBox Energy Software headquartered in Calgary, develops and markets gas & liquids measurement software solutions. Addressing markets such as, oil, gas, thermal, midstream, pipeline, and water measurement. IM-SCADA™ Software significantly lowers field operations costs. The software resides on the first PC that a gas/liquid well communicates to ensure that it is the “Truth” for the data.
